#### AR3220CE16

## **PAMLK**

# Installation and operating instructions

#### **General Instructions**

Read these instructions carefully prior to installation and use. Keep this manual for future reference.

The product may only be used as set out in the assembly and operating instructions. The guarantee is only valid should the product be used in the manner intended and in accordance with the instructions.

#### **Application area**

AR3200C is a compact air curtain for recessed mounting. The air curtain is available without heat, with electrical heating and with water heating. Recommended installation height for ambient and electrically heated units is 3,2 metres and recommended installation height for water heated unit is 2,8 metres. The air curtain has an integrated control system and can also be remote controlled.

Protection class for units with electrical heating: IP20

Protection class for units without heating and units with water heating: IP21.

# Operation

Air is drawn in from underneath and blown downwards shielding the door opening and minimizing heat loss. To achieve the optimum curtain effect the unit must extend the full width of the opening.

The grille for directing the outlet air is adjustable and is normally angled outwards to achieve the best protection against incoming air.

The efficiency of the air curtain depends on the air temperature, the pressure differential across the doorway and any wind load.

NOTE! Negative pressure in the building considerably reduces the efficiency of the air curtain. The ventilation should therefore be balanced.

# Mounting

The air curtain is installed horizontally with the outlet air grille facing downwards as close to the door as possible, concealed in the false ceiling. The only visible part of the unit is the underside which is level with the ceiling. The service hatch must be accessible, nothing should prevent it being fully opened.

The unit is ready for suspension with threaded bars on its outside. The threaded bars can also be fixed on the inside of the unit e.g.

when mounted on a solid suspended ceiling. For the protection of wider doorways, several units can be mounted in series alongside each other. Minimum distance from outlet to floor for electrically heated units is 1800 mm.

Mounting on threaded bars outside the unit

- 1. The mounting brackets are fixed to the unit during transport. Loosen these, turn them around and screw into place on the unit according to fig. 1a.
- 2. Hang on threaded bars (M8) according to fig. 1b (accessory).
- 3. Adjust the height using the lower nut so that the frame is level with the ceiling. Lock using the upper nut.

Mounting on threaded bars inside the unit

- 1. The mounting brackets are fixed to the unit during transport. Loosen them and screw them into place inside the unit in the intended holes. In order to mount the brackets, remove the service hatch, outlet grille and covering plates. See pages 6-7.
- 2. Hang on threaded bars (M8) according to fig. 2b (accessory).
- 3. Adjust the height using the lower nut so that the frame is level with the ceiling. Lock using the upper nut.

#### **Electrical installation**

The installation, which should be preceded by an isolator switch with a contact separation of at least 3 mm, should only be wired by a competent electrician and in accordance with the latest edition of IEE wiring regulations. The control system is pre-installed in the air curtain.

Unit without heating or with water heating
The electrical connection is made on the front
or on the top of the unit. Control (230V~) should
be connected to a terminal block in the terminal
box.

#### Unit with electrical heating

The electrical connection is made on the front or on the top of the unit. Control (230V~) and power supply for heat (400V3N~) should be connected to a terminal block in the terminal box.

The cable glands used must meet the protection class requirements. The largest cable area for the terminal block is 16 mm<sup>2</sup>. See wiring diagrams.

Туре	Outpu	Output Voltage			
	[kW]	[V]	[mm²]		
Control	0	230V~	1,5		
AR3210CE03	3	230V~	2,5		
AR3210CE05	5	230V~/400V3N~	6/1,5		
AR3210CE08	8	400V3N~	2,5		
AR3215CE08	8	400V3N~	2,5		
AR3215CE12	12	400V3N~	4		
AR3220CE10	10	400V3N~	2,5		
AR3220CE16	16	400V3N~	6		

<sup>\*)</sup> Dimensioning of external wiring shall comply with applicable regulations and local deviations may occur.

# Start-up (E)

When the unit is used for the first time or after a long period of non-use, smoke or an odour may result from dust or dirt which has collected on the element. This is completely normal and disappears after a short time.

#### Connecting the water coil (W)

The installation must be carried out by an authorised installer.

The water coil has copper tubes with aluminium fins and is suitable for connection to a closed water heating system. The heating coil must not be connected to a mains pressure water system or an open water system.

Note that the unit shall be preceded by a regulating valve, see Frico valve kit.

The connections to the heating coil must be equipped with shut off valves to allow trouble-free removal. Water coil is equipped with a drain and a vent valve. The water coil is connected via connections with dimensions DN15 (1/2"), outside thread, inside the unit. Knockouts are placed on the top and the side of the unit.

NOTE: Care must be taken when connecting the pipes. Use a pipe wrench or a similar tool to grip the air curtain connections to prevent straining of the pipes and subsequent water leakage during connection to the water supply pipe-work.

## Adjustment of the air curtain and airflow

The direction and speed of the airflow should be adjusted considering the load on the opening. Pressure forces affect the airstream and force it inwards towards the premises (when the premises are heated and the outdoor air is cold). The airstream should, therefore, be directed outwards to withstand the load. Generally speaking, the higher the load, the greater the angle required.

#### **Basic setting fan speed**

The fan speed when the door is open is set using the control. Note that the airflow direction and the fan speed may need fine adjustment depending on the loading of the door.

#### Filter (W)

The water coil is protected against dirt and blockage by an internal air filter which covers the coil face.

# Service, repairs and maintenance

For all service, repair and maintenance first carry out the following:

- 1. Disconnect the power supply.
- 2. The service hatch is opened by loosening the snap fixings located on the bottom of the unit (turn 90°). The hatch must be held when the snap fixings are loosened. See fig. 3a and 3b.
- 3. After service, repairs and maintenance close the service hatch and make sure that the snap fixings lock securely.

#### Maintenance

Unit with water heating

The appliance filter should be cleaned regularly to ensure the air curtain effect and heat emission from the device. How often depends on local circumstances. A clogged filter is not a risk, but the appliance function can fail.

- 1. Disconnect the power supply.
- 2. The service hatch is opened by loosening the snap fixings located on the bottom of the unit (turn 90°). The hatch must be held when the snap fixings are loosened. See fig. 3a and 3b.
- 3. Remove the filter and vacuum clean or wash it. If the filter is clogged or damaged, it may need to be changed.

#### All units

Since fan motors and other components are maintenance-free, no maintenance other than cleaning is necessary. The level of cleaning can vary depending on local conditions. Undertake cleaning at least twice a year. Inlet and exhaust grilles, impeller and elements can be vacuum cleaned or wiped using a damp cloth. Use a brush when vacuuming to prevent damaging sensitive parts. Avoid the use of strong alkaline or acidic cleaning agents.

#### **Overheating**

The air curtain unit with electrical heating is equipped with an overheat protection. If it is deployed due to overheating, reset as follows:

- 1. Disconnect the power supply with the isolator switch.
- 2. Determine the cause of overheating and rectify the fault.
- Open the service hatch. Locate the red button next to the terminal box inside the air curtain.
   The 2 metre unit is equipped with two red buttons, one on each terminal box.
- 4. Press the red button until a click is heard.
- 5. Reconnect the unit.

All motors are equipped with an integral thermal safety cut-out. This will operate, stopping the air curtain should the motor temperature rise too high. The cut-out will automatically reset when the motor temperature has returned to within the motor's operating limits.

#### Temperature control

See control pages.

# Replacing motor or impeller

- 1. Remove frame and side panel.
- 2. Remove the screw between motor and fan.
- 3. Disconnect the cables to the motor.
- 4. Remove the screws securing the motor and lift it out together with the impeller.
- 5. Install the new motor and/or the new impeller as above in reverse order.

# Replacing heating elements/heating package (E)

- 1. Mark and disconnect the cables to the heating elements/package.
- 2. Remove the mounting screws securing the heating elements/package in the unit and lift the heating elements/package out.
- 3. Install the new heating elements/package in reverse order to the above.

# Replacing the water coil (W)

- 1. Shut off the water supply to the unit.
- 2. Open the vent valve.
- 3. Open the drain valve.
- 4. When the water coil is empty, disconnect its connections.
- 5. Remove the covering plate.
- 6. Remove the mounting screws securing the coil in the unit and lift out.

- 7. Move the filter to the new unit.
- 8. Install the new coil in reverse order to the above.

## Draining the water coil (W)

The drain valve is on the underside of the coil on the connector side. It can be accessed via the service hatch.

## **Troubleshooting**

If the fans are not running or do not perform properly, check the following:

- The functions and settings of the built-in control system.
- That the intake grille/filter is not dirty.

*If there is no heat, check the following:* 

 The functions, internal sensor and settings of the built-in control system.

For units with electrical heating, also check the following:

- Power supply to electric heater coil; check fuses and circuit-breaker (if any).
- That the overheat protection has not been deployed.

For units with a water coil, also check the following:

- · That the water coil is vented
- That there is sufficient water flow and pressure.
- That the incoming water is heated adequately.
- That the valves and the actuators are correctly installed and working.

If the fault cannot be rectified, please contact a qualified service technician.

#### Residual current circuit breaker (E)

When the installation is protected by means of a residual current circuit breaker, which trips when the appliance is connected, this may be due to moisture in the heating element. When an appliance containing a heater element has not been used for a long period or stored in a damp environment, moisture can enter the element.

This should not be seen as a fault, but is simply rectified by connecting the appliance to the main supply via a socket without a safety cut-out so that the moisture can be eliminated from the element. The drying time can vary

from a few hours to a few days. As a preventive measure, the unit should occasionally be run for a short time when it is not being used for extended periods of time. CAUTION — Some parts of this product can become very hot and cause burns. Particular attention has to be given where children and vulnerable people are present.

#### **Packaging**

Packaging materials are chosen with consideration to the environment and are therefore recyclable.

# Handling of product at end of working life

This product may contain substances necessary for the functionality of the product but potentially dangerous for the environment. The product should not be disposed of mixed with general household waste but delivered to a designated collection point for environmental recycling. Please contact the local authority for further details of your nearest designated collection point.

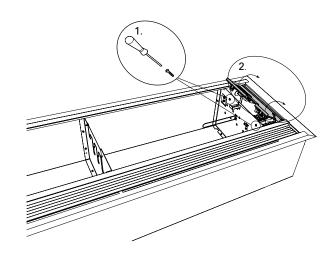

#### Safety

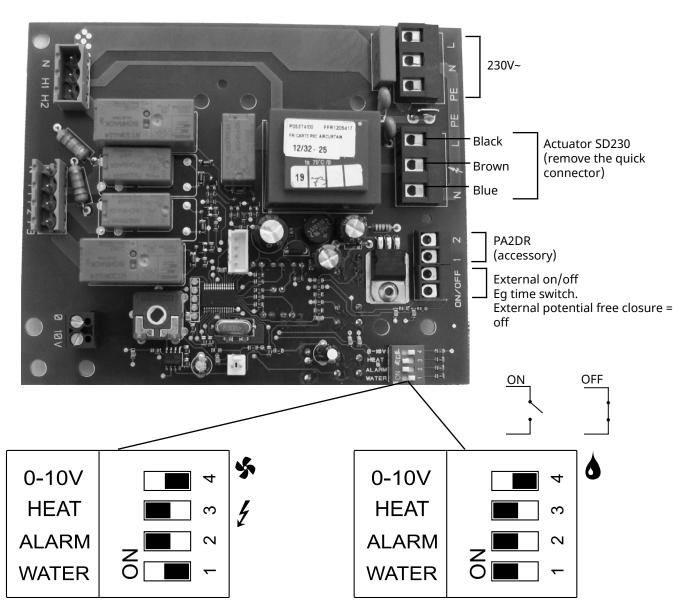

- For all installations of electrically heated products a residual current circuit breaker 300 mA for fire protection must be used.
- Keep the areas around the air intake and exhaust grilles free from possible obstructions!
- The unit must not be fully or partially covered as overheating can result in a fire risk!
- Lifting equipment must be used to lift the unit.
- This appliance can be used by children aged from 8 years and above and persons with reduced physical, sensory or mental capabilities or lack of experience and knowledge if they have been given supervision or instruction concerning use of the appliance in a safe way and understand the hazards involved. Children shall not play with the appliance. Cleaning and user maintenance shall not be made by children without supervision.
- Children of less than 3 years should be kept away unless continuously supervised.
- Children aged from 3 years and less than 8 years shall only switch on/off the appliance provided that it has been placed or installed in its intended normal operating position and they have been given supervision or instruction concerning use of the appliance in a safe way and understand the hazards involved.
- Children aged from 3 years and less than 8 years shall not plug in, regulate and clean the appliance or perform user maintenance.

#### Control

The control system is integrated in the air curtain. The air curtain can be regulated with a remote control or by the control panel placed inside the service hatch.

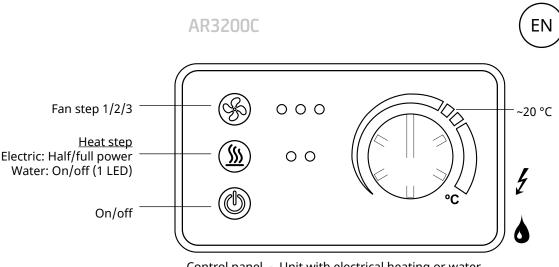

Factory setting dip-switches - Unit without heating or with electrical heating

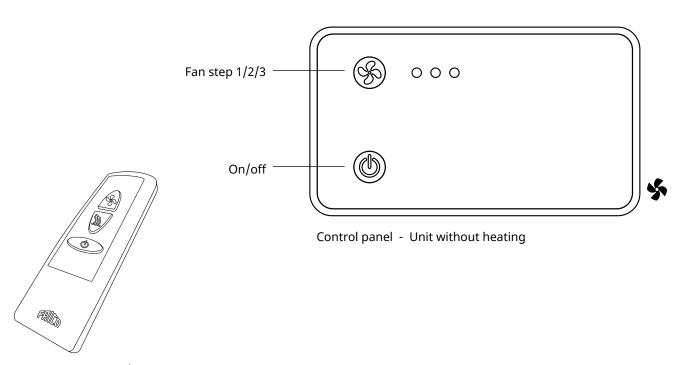

Dip-switch 3 is used for PA2DR (optional).

Factory setting dip-switches - Unit with water heating

Dip-switch 3 is used for PA2DR (optional).

Control panel - Unit with electrical heating or water heating

Remote control - on/off, fan steps and heating steps

#### **Functional test**

Functional test is started using the remote control.

Push

and

in 5 seconds

Fan and heatings steps are tested in 10-second intervals which is indicated by lighted LEDs. When the test is completed, all LEDs will flash for 30 seconds.

#### **Temperature control**

If the temperature exceeds 50 °C, the fan runs at full speed for 2 minutes to vent out the heat, if the temperature rises above 50 °C again during the following 5 minutes overheating alarm is deployed. The red LEDs flash and all the buttons are locked.

- 1. Disconnect the power supply with the isolator switch.
- 2. Determine the cause of overheating and rectify the fault.
- 3. Reconnect the unit.
